Brian Kloppenborg Challenges Related to Interferometric Imaging

#### Outline

Solving a Long Standing Problem in Astrophysics Introduction to image reconstruction New Insights

# Outline

Solving a Long Standing Problem in Astrophysics
 Epsilon Aurigae

#### 2 Introduction to image reconstruction

- What is an interferometer?
- Interferometric Observables
- UV Coverage
- Image Reconstruction

#### 3 New Insights

- Simple Parameters
- Orbital Parameters
- Velocities and Mass Ratios

・ 同 ト ・ ヨ ト ・ ヨ ト

## $\epsilon$ Aurigae

The Light Curve of  $\epsilon$  Aurigae suggests it is an eclipsing binary, except:

**Epsilon Aurigae** 

• The eclipse lasts for 15 months

イロト イヨト イヨト イヨト

æ

**Epsilon Aurigae** 

## $\epsilon$ Aurigae

The Light Curve of  $\epsilon$  Aurigae suggests it is an eclipsing binary, except:

- The eclipse lasts for 15 months
- The eclipse happens once every 27.1 year

**Epsilon Aurigae** 

## $\epsilon$ Aurigae

The Light Curve of  $\epsilon$  Aurigae suggests it is an eclipsing binary, except:

- The eclipse lasts for 15 months
- The eclipse happens once every 27.1 year
- The spectrum looks like a 15  $M_{\odot}$  F-Super giant star.

**Epsilon Aurigae** 

## $\epsilon$ Aurigae

The Light Curve of  $\epsilon$  Aurigae suggests it is an eclipsing binary, except:

- The eclipse lasts for 15 months
- The eclipse happens once every 27.1 year
- The spectrum looks like a 15  $M_{\odot}$  F-Super giant star.
- Until Recently, no significant evidence for the companion star.

**Epsilon Aurigae** 

## $\epsilon$ Aurigae

The Light Curve of  $\epsilon$  Aurigae suggests it is an eclipsing binary, except:

- The eclipse lasts for 15 months
- The eclipse happens once every 27.1 year
- The spectrum looks like a 15 M<sub>☉</sub> F-Super giant star.
- Until Recently, no significant evidence for the companion star.
- So, what is causing the eclipse?

#### **Epsilon** Aurigae

 Largest star in the universe (Kuiper, G. P. and Struve, O. and Strömgren, B.; 1937)

## Scientific Relavance

- Simple Binary Stars
  - Period
  - Luminosity
  - Radii
  - Temperatures
- Something new or interesting?
  - Massive  $\implies$  luminous, where is the companion?
  - Large Obscuring Object: Dark Matter, black hole?
  - New Evolutionary state for stars or PN?

- 4 回 ト 4 ヨ ト 4 ヨ ト

**Epsilon Aurigae** 

Why do we need interferometry?

- Previous observations give models, no confirmation.
- Biggest telescopes lack sufficient resolution:
  - Keck Telescopes: 10 m, 55 mas (268 nrad)
- Need direct observations to continue developing theory.
